

Sea-Horse Optimizer

Dr. Broderick Crawford Labrín

Pontificia Universidad Católica de Valparaíso

Sea-Horse Optimizer (SHO)

- Fue desarrollada por Shijie Zhao et. al. en el año 2022 ^a.
- Es una metaheurística basado en población diseñada para resolver problemas de optimización continuos.
- Sus soluciones (individuos) iniciales se generan aleatoriamente y se van alterando bajo un conjunto de reglas de movimiento con criterios estocásticos.

^aSea-horse optimizer: a novel nature-inspired meta-heuristic for global optimization problems, Springer Link (2022)

- Ecuaciones de movimientos general

$$\sigma = \frac{\Gamma(1 + \lambda) \cdot \sin\left(\frac{\pi\lambda}{2}\right)}{\Gamma\left(\frac{1+\lambda}{2}\right) \cdot \lambda \cdot 2^{\frac{\lambda-1}{2}}} \quad (1)$$

$$\text{Levy}(z) = s \cdot \frac{W \cdot \sigma}{|k|^{1/\lambda}} \quad (2)$$

- Donde:

- λ es un número aleatorio entre $[0, 2]$
- s es una constante que influye en la fase de exploración del algoritmo.
- W, k son números aleatorios entre $[0, 1]$.

- Ecuaciones de movimientos general

$$\rho = u \cdot \exp(\theta v) \quad (3)$$

$$x = \rho \cdot \cos(\theta) \quad (4)$$

$$y = \rho \cdot \sin(\theta) \quad (5)$$

$$z = \rho \cdot \theta \quad (6)$$

- Donde:

- ρ es una variable que representa la longitud de la cola del caballo de mar
- u, v son constantes de espiral logarítmica
- θ es un número aleatorio entre $[0, 2\pi]$
- x, y, z representan la posición en el entorno

- Ecuaciones de movimientos general

$$X_{1_{\text{new}}}(t+1) = X_i(t) + \text{Levy}(\lambda)((\text{Best}(t) - X_i(t)) \cdot x \cdot y \cdot z + \text{Best}(t)) \quad (7)$$

- Dónde:
 - *eq.7* representa la nueva posición que tomará el caballo de mar para búsqueda local

- Ecuaciones de movimientos general

$$\beta_t = \frac{1}{\sqrt{2\pi}} \cdot \exp\left(-\frac{x^2}{2}\right) \quad (8)$$

$$X_{1_{\text{new}}}(t + 1) = X_i(t) + \text{rand} \cdot l \cdot \beta_t \cdot (X_i(t) - \beta_t \cdot \text{Best}(t)) \quad (9)$$

- Donde:
 - l es un valor constante
 - eq.8 es el coeficiente de caminata aleatoria
 - eq.9 representa la nueva posición que tomará el caballo de mar para búsqueda global

- Ecuaciones de movimientos general

$$\alpha = \left(1 - \frac{t}{MaxIter}\right)^{\frac{2t}{MaxIter}} \quad (10)$$

$$X_{new}^2(t+1) = \begin{cases} \alpha \cdot (\text{Best} - \text{rand} \cdot X_{new}^1(t)) + (1 - \alpha) \cdot \text{Best}, r_2 > 0,1 \\ (1 - \alpha) \cdot (X_{new}^1(t) - \text{rand} \cdot \text{Best}) + \alpha \cdot X_{new}^1(t), r_2 \leq 0,1 \end{cases} \quad (11)$$

- Donde:
 - *MaxIter* representa el número máximo de iteraciones
 - α factor de ajuste de movimiento

- Ecuaciones de movimientos general

$$X_i^{\text{father}} = X_{\text{sort}}^2(1 : N/2) \quad (12)$$

$$X_i^{\text{mother}} = X_{\text{sort}}^2(N/2 + 1 : N) \quad (13)$$

$$X_i^{\text{offspring}} = r_3 \cdot X_i^{\text{father}} + (1 - r_3) \cdot X_i^{\text{mother}} \quad (14)$$

- Donde:
 - N Tamaño de la población

Algorithm 1 Sea-Horse Optimizer

```
Input: Population  $X = \{x_1, x_2, \dots, x_N\}$ 
Output: Updated population  $X' = \{x'_1, x'_2, \dots, x'_n\}$  and Best
1: Initialize random sea-horse population X; constants u, v, l,  $\lambda$  and s
2: for it = 1 to MaxIt do
3:     calculate the fitness of each X
4:     select Best
5:      $\beta = \text{randn}(N, \text{dim})$ 
6:      $r1 = \text{randn}(\text{dim})$ 
7:     for i=0 to N do
8:         for j=0 to dim do
9:             if  $r1[j] > 0$ 
10:                  $w = \text{random}()$ 
11:                  $k = \text{random}()$ 
12:                  $\sigma = (\Gamma(1 + \lambda) * \sin(\pi * \lambda/2)) / (\Gamma((1 + \lambda)/2) * \lambda * 2^{(\lambda - 1)/2})$ 
13:                  $\text{levy} = \text{levy}() = s * ((w * \sigma) / (|k|^{(1/\lambda)}))$ 
14:                  $\theta = \text{random}(0, 2 * \pi)$ 
15:                  $p = u * \exp(\theta * v)$ 
16:                  $x = p * \cos(\theta)$ 
17:                  $y = p * \sin(\theta)$ 
18:                  $z = p * \theta$ 
19:                  $X[i,j] = X[i,j] + \text{levy} * (\text{Best}[j] - X[i,j]) * x * y * z + \text{Best}[j]$ 
20:             else
21:                  $X[i,j] = X[i,j] + \text{random}() * 1 * \beta[i,j] * (X[i,j] - \beta[i,j] * \text{Best}[j])$ 
22:             Handle variables out of bound
23:          $\alpha = (1 - \text{it} / \text{maxIter})^{(2 * \text{it}) / \text{maxIter}}$ 
```

```
24:         for i=0 to N do
25:             for j=0 to dim do
26:                 r2 = random()
27:                 if r2 > 0.1
28:                     X[i,j] =  $\alpha$  * (Best[j] - random()*X[i,j])
29:                 else
30:                     X[i,j] = ((1- $\alpha$ ) * (X[i,j] - random() * Best[j]) +  $\alpha$  * X[i,j])
31:                 Handle variables out of bound. Calculate the fitness value of each sea-horse
32:             sortIndex = argsort(fitness)
33:             father = X[sortIndex[:N // 2]]
34:             mother = X[sortIndex[N // 2:]]
35:         for k=0 to N//2 do
36:             r3 = random()
37:             for j=0 to dim do
38:                 offspring[k,j] = r3 * father[k,j] + (1 - r3) * mother[k,j]
39:             Handle variables out of bound. Calculate the fitness value of each offspring
40:         Select the next iteration population from the offspring and X ranked top N in fitness values
41: return updated population X' and Best
```

Considerando

$$\text{Min } z = x_1^2 + x_2^2$$

Sujeto a

$$x_1, x_2 \in [-100, 100]$$

Configuración inicial de SHO:

- Tamaño de la población: 2 individuos
- Número máximo de iteraciones: 100 iteraciones
- $u, v, l = 0,05$
- $\lambda = 1,5$
- $s = 0,01$

Soluciones iniciales:

ind 1: [-84.0678 , 92.4701] / fitness: 15618.1074

ind 2: [-2.6283 , 78.794] / fitness: 6215.3974

Mejor solución:

ind 1: [-2.6283 , 78.794] / fitness: 6215.3974
